## SUMMARY

**Pharmacognosy** with 9 ECTS (6 credits in the first semester and 3 credits in the second), is given annually in the third year of degree in pharmacy. This subject is a branch of Pharmacological Sciences that has a long tradition in the Pharmacy studies, and brings to the student the knowledge on the **materials of biological origin** (crude drugs) obtained from **plants, animals or microorganisms**, both terrestrial and marine, useful for obtain medicines. Its development, like other sciences has experienced periods of great splendor with other ones slow progress. Currently there is a great interest in such natural sources, because they furnish from the secondary metabolism a large number of compounds that are difficult or commercially unprofitable to produce by synthesis. Furthermore, certain secondary metabolites are subject to semisynthetic change to become more effective or less toxic drugs. It is also possible to obtain molecules useful as a lead compounds for synthetic drugs with similar activity to that of the original.
The theoretical content of this matter is organized following a biogenetic-chemical criterion for the classification of the most common chemical groups of drugs. At the beginning, some lessons, essential for understanding the whole content are proposed. In these units the multidisciplinary nature of this subject will be evident through the connections with more or less closely related, previously studied, matters (Plant Physiology, Botany, Physiology, Organic Chemistry, Analytical Chemistry, Biochemistry, Microbiology ....) and with other disciplines that will be simultaneously studied along the same academic year (Pharmaceutical Chemistry, Pathophysiology, Pharmacology I, etc.)

The theoretical aspects are supplemented by laboratory practice, by means of which, the students should acquire the basic techniques in a laboratory of Pharmacognosy to allow experimental studies on some of the concepts developed in the lectures.

### PREVIOUS KNOWLEDGE

**Relationship to other subjects of the same degree**

There are no specified enrollment restrictions with other subjects of the curriculum.

**Other requirements**

It is suggested to have knowledge of Botany, Organic Chemistry, Analytical Techniques, Instrumental Techniques and Physiology.

### OUTCOMES

**1201 - Grado de Farmacia**

- To know how interpret, value and communicate relevant data in the different aspects of pharmaceutical activity, making use of information and communication technologies.
- Skill to communicate ideas, analyze problems and solve them with a critical mind, achieving team-working abilities and assuming leadership whenever required.
- Development of skills to update their knowledge and undertake further studies, including pharmaceutical specialization, scientific research and technological development, and teaching.
- Ability to collect and transmit information in English with a level of competence similar to the B1 of the Council of Europe.
- To recognize personal limitations and the need to keep up to date professional competence, paying particular attention to the self-learning of new knowledge based on available scientific evidences.
- Handle with precision and safety products, equipment and laboratory equipment.
- Identify, obtain, analyze and produce drugs and other products and raw materials of health interest for human or veterinary use.
- Know and identify the raw materials of biological origin (crude drugs) that are used to obtain drugs and medicines based on medicinal plants.
- To know the bases and stages of the analytical control of vegetal drugs.
- Know the use, efficacy and safety of medicinal plants.
- To know the main structural types of secondary metabolites used to obtain drugs and their relationship with biosynthetic pathways.
- Acquire the ability to design the extraction and purification method more suitable for the isolation of the active principles of a crude drug, as well as know how to apply the spectroscopic techniques to the structural elucidation of the same.
- To know the pharmacological activity of the active principles of those crude drugs, which for their therapeutic interest, are considered the more important vegetal drugs.
- Understand the use of natural products as "lead compounds" for the development of new drugs.
- Open new perspectives for the development of biotechnology in the investigation of living organisms as sources of new active principles.

**LEARNING OUTCOMES**

The main objective for the learning of Pharmacognosy is achieved through lectures, practical sessions, tutorials, seminars, by means of that the students acquire the general theoretical and practical knowledge in the field of crude drugs as source of medicines.

* Using adequately the basic scientific terminology related to the subject of Pharmacognosy.
* Knowing the basic skeleton of the different types of active secondary metabolites present in crude drugs and relate them to their biogenesis.
* From the chemical structure of the active principle, deducting their physico-chemical properties and applying appropriate methods for extraction, purification and isolation.
* Knowing and understanding the indications of the Pharmacopoeia for quality control of officinal crude drugs, paying attention to some of the main morphological elements.
* Knowing the origin of the most representative drugs, their active principles, pharmacological activity and therapeutic use.
* Distinguishing between the pharmacological action of the isolated active principle and the action of the whole crude drug.
* Knowing and understanding the use of natural products as "lead compounds" for the development of new medicines.
* Understanding the use, efficacy and safety of medicinal plants.
* Understanding the interactions of herbs with conventional medicines.
* Knowing and understanding scientific papers related to the subject.

**DESCRIPTION OF CONTENTS**

1. Block I. Generalities

2. Block II. Study of the active principles of drugs, according to their biosynthetic origin

Derivatives of MONOSACCHARIDES
UNIT 5. Oligosaccharides. Homogeneous and heterogeneous polysaccharides
ACETATE and SHIKIMATE derivatives, lipids and polyphenols
UNIT 6. Lipids and related compounds. Statins
MEVALONIC ACID derivatives: terpenoids
AMINO ACID derivatives: alkaloids
UNIT 15. Generalities of alkaloids.

3. Laboratory Practices. Analysis and control of herbal drugs
SESSION 4. Anthracene glycosides containing-drugs: Cassia sp. leaves.
SESSION 7. Determination of active compounds in a problem drug: extraction, qualitative or quantitative determination. Written report as a scientific paper including introduction, methods, results and discussion, conclusions and bibliography.

TEACHING METHODOLOGY

The matter is structured in order to the student will be the protagonist of their own learning.

*Theoretical classes.* Students must reinforce the basic knowledge included on the program through self-study and class assistance. Before the end of class the teacher will consider a number of questions that can be answered by students and, with them, focus the most important concepts of the unit and other aspects of particular complexity.

After each block of units, a summary will provide to the students the ability to relate the contents of different units. To encourage active student participation, the teacher will alternate the above methodology with case studies, problem solving, analysis of readings, press notes etc.

In the individual study, and in the preparation of the units in depth, the teacher will show students the adequate literature and provide the necessary support material.
*Laboratory practice. Labs are structured in 8 sessions of 3.5 hours each, four in the first semester and four in the second one. The student has to complete a pre-laboratory assistance consisting in the understanding of the script of practice, the review of the theoretical concepts involved and the preparation of a scheme of the working process. At the beginning of each session, the teacher will report on the most important aspects of experimental work and assist to the student during the session. Once the corresponding practice was made, the student will analyze the observed facts and solve some questions proposed by the teacher at the beginning of the session or during the course of practice. In the seventh session, a drug problem will be given on which the teacher raises a number of questions. Each student will plan using the practice outlines, his lab notebook and appropriate manuals. After the implementation of the proposed plan, a report, in a scientific paper format, will be delivered and exposed to the other students in the last session, for a maximum period of 15 minutes. Then a time of debate about reasoning, methodological aspects, interpretation given to the results and conclusions reached, will be open. The teacher may assess the realization by pairs.

*Tutorials. The tutorials are organized in small groups of students, according to the timetable established by the Faculty (two sessions in each semester). In them, the teacher will evaluate the process of student learning in a globalized manner. Similarly, in the tutorial students will be advised about the strategies to follow in order to avoid the difficulties that they may have. The teacher may propose an individual or collective specific questions according to the needs of students that will be analyzed and discussed on the date by mutual agreement.

*Seminars. They consist of the preparation and exposure to other students of a work carried out by subgroups of four or five students about a subject of Pharmacognosy or about a multidisciplinary subject proposed by several teachers. In these seminars students will exercise the search of information, the ability to outline and summarize as well as oral and written expression together promoting teamwork. The theme and date of exposure will be established at the beginning of course in coordination with the other matter.

*Other activities. These classroom activities are aimed at the search and projection of videos, films and/or documentaries related to the subject, as well as the realization by subgroup of three or four students of different games with questions of increasing difficulty, in order to obtain information about their teaching-learning process.

**EVALUATION**

In the evaluation of student learning, all aspects described in the methodology section of this guide will be considered and evaluated continuously by the teacher.

10% of the qualification (1.0 point): the result of the preparation and presentation of work in the seminars.
20% of the qualification (2.0 points): the qualification of the practical sessions, which will be of compulsory assistance. The score will take into account the participation (10%), performance in the laboratory (30%) and the mark of the practical exam (60%). In case a student fails the subject the year that they were taken, the score obtained will be applicable to only the consecutive year.

65% of the qualification (6.5 points): the results obtained in the exams. The two exams will be performed in the periods established by the Faculty: January 2017 (First Part), May-June 2017 (Second Part) and June-July 2017 (Final Exam). Except units 1-4, the rest of the theoretical contents corresponding to the first part will drop off for the second one. Both exams will consist in a series of questions that require students to relate aspects discussed in various units or even complementary aspects studied in other matter. It may also include a theme to develop, which can demonstrate the ability to synthesize and written expression acquired by the student.

5% of the qualification: (0.5 points): will be from the direct evaluation of the teacher with the student, in the various forms of programmed learning. It will take into account different aspects such as participatory assistance, progress in the use of language characteristic of matter, critical thinking, ability to work in groups, etc.

In any case, to pass the course is necessary to obtain a positive evaluation (5 out of 10 points) in each of the semesters and laboratory practices.
