SUMMARY

The *Laboratory of Physical Chemistry II* is a compulsory subject that is taught in the sixth semester during the 3rd year of the degree in Chemistry.

It is a laboratory that makes emphasis on experimentation in chemical thermodynamics of interfaces, spectroscopy, electrochemistry, photochemistry, quantum chemistry, and chemical kinetics. In the laboratory, different instrumental techniques are applied to the study of systems of chemical-physical interest and computers are used for the study of atoms and molecules.

R5-OBLIGATION TO PURSUE THE COURSE SIMULTANEOUSLY

34195 - Physical Chemistry III

36451 - Physical Chemistry II

34195 - Physical Chemistry III

36451 - Physical Chemistry II

34195 - Physical Chemistry III

36451 - Physical Chemistry II

Other requirements

It is recommended that the student has prior knowledge taught in the subjects Physical Chemistry I, II and III, Physical Chemistry Laboratory I, Chemical Informatics, and Mathematics I and II.

Basic knowledge of Physical Chemistry related to:

Formal kinetics.

Spectroscopy.

Electrochemistry

Kinetic theory of gases.

Thermodynamics of two-phase systems.

Quantum Chemistry of molecular Systems.

And general knowledge of:

Chemical nomenclature and stoichiometric calculations.

Prepar

OUTCOMES

1110 - Degree in Chemistry

- Develop capacity for analysis, synthesis and critical thinking.
- Show inductive and deductive reasoning ability.
- Demonstrate leadership and management skills, entrepreneurship, initiative, creativity, organization, planning, control, leadership, decision making and negotiation.

- Solve problems effectively.
- Demonstrate ability to work in teams both in interdisciplinary teams and in an international context.
- Demonstrate ability to communicate information, ideas, problems and solutions to both specialist and non-specialist audiences and using information technology, as appropriate.
- Demonstrate a commitment to ethics, equality values and social responsibility as a citizen and as a professional.
- Learn autonomously.
- Demonstrate the ability to adapt to new situations.
- Acquire a permanent sensitivity to quality, the environment, sustainable development and the prevention of occupational hazards.
- Demonstrate knowledge of the main aspects of chemical terminology, nomenclature, conventions and units.
- Interpret the variation of the characteristic properties of chemical elements according to the periodic table.
- Demonstrate knowledge of the characteristics and behaviour of the different states of matter and the theories used to describe them.
- Demonstrate knowledge of the main types of chemical reaction and their main characteristics.
- Demonstrate knowledge of the principles of quantum mechanics and their application to the description of the structure and properties of atoms and molecules.
- Demonstrate knowledge of the principles of thermodynamics and kinetics and their applications in chemistry.
- Relate the macroscopic properties and the properties of individual atoms and molecules, including macromolecules (natural and synthetic), polymers, colloids and other materials.
- Demonstrate knowledge and understanding of essential facts, concepts, principles and theories related to the areas of chemistry.
- Solve qualitative and quantitative problems following previously developed models.
- Recognise and analyse new problems and plan strategies to solve them.
- Evaluate, interpret and synthesise chemical data and information.
- Handle chemicals safely.
- Handle the instrumentation used in the different areas of chemistry.
- Interpret data from observations and measurements in the laboratory in terms of their significance and the theories that underpin them.
- Relate theory and experimentation.
- Recognise and evaluate chemical processes in daily life.
- Understand the qualitative and quantitative aspects of chemical problems.

- Develop sustainable and environmentally friendly methods.
- Relate chemistry with other disciplines.
- Students must be able to apply their knowledge to their work or vocation in a professional manner and have acquired the competences required for the preparation and defence of arguments and for problem solving in their field of study.
- Students must have the ability to gather and interpret relevant data (usually in their field of study) to make judgements that take relevant social, scientific or ethical issues into consideration.
- Students must be able to communicate information, ideas, problems and solutions to both expert and lay audiences.
- Students must have developed the learning skills needed to undertake further study with a high degree of autonomy.
- Express oneself correctly, both orally and in writing, in any of the official languages of the Valencian Community.
- Have basic skills in the use of information and communication technology and properly manage the information obtained.

LEARNING OUTCOMES

The previous section includes the competences contained in the document VERIFICA. This subject addresses part of the learning results of the matter Physical chemistry laboratory II that allow to acquire specific knowledge of chemistry, cognitive skills and general skills recommended by the EUROPEAN CHEMISTRY THEMATIC NETWORK (ECTN) for the Chemistry Eurobachelor® Label. The following table lists the learning outcomes acquired in the subject Physical chemistry laboratory II related to the competences of the degree in Chemistry.

SPECIFIC KNOWLEDGE OF CHEMISTRY	
The learning process should allow the degree graduates to demonstrate:	
	Competences of the subject Physical chemistry laboratory II that contemplate the learning outcomes EUROBACHELOR®
The principal techniques of structural investigations, including spectroscopy	Ability to recognise chemical elements and their compounds: preparation, structure, reactivity, properties and applications..(CE7).

	<p>Handle the instrumentation used in the different areas of chemistry.(CE19).</p> <p>Demonstrate knowledge of the principles, procedures and techniques for the determination, separation, identification and characterisation of chemical compounds.(CE8)</p>
The characteristics of the different states of matter and the theories used to describe them.	Demonstrate knowledge of the characteristics and behaviour of the different states of matter and the theories used to describe them..(CE3).
The principles of thermodynamics and their applications to chemistry	Demonstrate knowledge of the principles of thermodynamics and kinetics and their applications in chemistry..(CE6).
The principles of quantum mechanics and their application to the description of the structure and properties of atoms and molecules	Demonstrate knowledge of the principles of quantum mechanics and their application to the description of the structure and properties of atoms and molecules..(CE5).
The kinetics of chemical change, including catalysis; the mechanistic interpretation of chemical reactions	Demonstrate knowledge of the principles of thermodynamics and kinetics and their applications in chemistry..(CE6).

COMPETENCES AND COGNITIVE SKILLS

The learning process should allow the degree graduates to demonstrate:

	Competences of the subject Physical chemistry laboratory II that contemplate the learning outcomes EUROBACHELOR®
--	---

Ability to demonstrate knowledge and understanding of the facts, concepts, principles and fundamental theories related to the topics mentioned above.	Demonstrate knowledge and understanding of essential facts, concepts, principles and theories related to the areas of chemistry..(CE13).
Ability to apply this knowledge and understanding to the solution of common qualitative and quantitative problems.	Solve qualitative and quantitative problems following previously developed models..(CE14). Recognise and analyse new problems and plan strategies to solve them..(CE15). Understand the qualitative and quantitative aspects of chemical problems..(CE24).
Competences to present and argue scientific issues orally and in writing to a specialized audience.	Relate chemistry with other disciplines.(CE26). Demonstrate ability to communicate information, ideas, problems and solutions to both specialist and non-specialist audiences and using information technology, as appropriate. (CG6). Students must be able to communicate information, ideas, problems and solutions to both expert and lay audiences..(CB4).
Ability to calculate and process data, related to information and chemistry data.	Solve qualitative and quantitative problems following previously developed models..(CE14). Recognise and analyse new problems and plan strategies to solve them..(CE15).

COMPETENCES AND COGNITIVE SKILLS RELATED TO THE PRACTICE OF CHEMISTRY**The learning process should allow the degree graduates to demonstrate:**

	Competences of the subject Physical chemistry laboratory II that contemplate the learning outcomes EUROBACHELOR®
Capacities to handle chemical products safely, taking into account their physical and chemical properties, including any risk associated with their use.	Handle chemicals safely..(CE17).
	Evaluate the risks in the use of chemicals and laboratory procedures..(CE21).
Capacities to monitor, observe and measure the chemical properties, facts or changes, and perform their registration (collection) and documentation in a systematic and reliable way.	Handle the instrumentation used in the different areas of chemistry..(CE19).
	Relate theory and experimentation..(CE22).
	Recognise and evaluate chemical processes in daily life..(CE23).
	Understand the qualitative and quantitative aspects of chemical problems..(CE24).
Ability to interpret data derived from observations and laboratory measurements in terms of their relevance, and relate them to the appropriate theory.	Interpret data from observations and measurements in the laboratory in terms of their significance and the theories that underpin them..(CE20).
	Relate theory and experimentation..(CE22).
	Recognise and evaluate chemical processes in daily life..(CE23).
	Understand the qualitative and quantitative aspects of chemical problems..(CE24).
Ability to perform risk assessments of the use of chemical substances and laboratory procedures.	Relate chemistry with other disciplines.(CE26).
	Understand the qualitative and quantitative aspects of chemical problems..(CE24).
	Develop sustainable and environmentally friendly methods.(CE25).
	Evaluate the risks in the use of chemicals

	and laboratory procedures..(CE21).
--	------------------------------------

GENERAL COMPETENCES	
The learning process should allow the degree graduates to demonstrate:	
	Competences of the subject Physical chemistry laboratory II that contemplate the learning outcomes EUROBACHELOR®
Calculation and arithmetic capabilities, including aspects such as analysis error, estimates of orders of magnitude, and correct use of the units.	Develop capacity for analysis, synthesis and critical thinking.. (CG1). Show inductive and deductive reasoning ability..(CG2). Solve problems effectively..CG4).
Competences in information management, in relation to primary and secondary sources, including information retrieval through on-line searches.	Demonstrate ability to communicate information, ideas, problems and solutions to both specialist and non-specialist audiences and using information technology, as appropriate..(CG6). Have basic skills in the use of information and communication technology and properly manage the information obtained.(CT2).
Ability to adapt to new situations and make decisions.	Demonstrate the ability to adapt to new situations..(CG9). Recognise and analyse new problems and plan strategies to solve them..(CE15).
Skills related to information technology such as word processing, spreadsheet, recording	Demonstrate ability to communicate information, ideas, problems and solutions to both specialist and non-specialist audiences

and storage of data, internet use related to the subjects.	and using information technology, as appropriate..(CG6). Have basic skills in the use of information and communication technology and properly manage the information obtained.(CT2).
Ethical commitment to the European Code of Conduct:	Acquire a permanent sensitivity to quality, the environment, sustainable development and the prevention of occupational hazards.(CG10). Demonstrate a commitment to ethics, equality values and social responsibility as a citizen and as a professional. (CG7).

This course will address the following learning outcomes contained in the document of degree in the Physical Chemistry matter. These results must allow that at the end of the course the student is able to:

1. Demonstrate ability to define the State of a chemical system in function of their macroscopic properties, and analyze its spontaneous evolution.
2. Demonstrate ability to understand and predict the behavior and reactivity of atoms and molecules based on an analysis of its structure, which can be determined from spectroscopic data.
3. Understand and effectively use the bibliographic and technical information concerning the physicochemical phenomena.
4. Perform effectively the tasks assigned as member of a team and with a gender perspective.
5. Solve problems with rigour.
6. Demonstrate adaptation to new situations.
7. Demonstrate capacity for analysis and synthesis.
8. Demonstrate ability to inductive and deductive analysis.
9. Demonstrate capacity for organization and planning.
10. Demonstrate leadership and gender perspective.
11. Demonstrate skill in the management of the main instrumental techniques used in chemistry and to be able to determine through experimental work the thermodynamic and structural properties, and the kinetic behavior of chemical systems.

12. Demonstrate skill in the treatment and spread of errors of the quantities measured in the laboratory and skill in handling of software to carry out the treatment of experimental data.
13. Demonstrate skill in the management of computer software for calculation of microscopic properties of matter and of simulation programs of those techniques which are not possible to have in the laboratory because of its high cost.
14. Demonstrate ability to perform rigorously a report of an experiment undertaken in the laboratory and to develop a diary of laboratory including an account of all practical sessions.
15. Write and expose in the native languages with correction.
16. Manage information rigorously.
17. Show with a gender perspective and ethical commitment.

Finally,

Demonstrate an ethical and responsible conduct in the exercise of their professional work, values that are transmitted by teachers and researchers of the University, as a generator and transmitter of scientific knowledge.

DESCRIPTION OF CONTENTS

1. Study of an oscillating reaction: the Belousov-Zhabotinskii reaction

The existence of oscillations in the concentration of some intermediate species involved in the reaction is shown by means of electromotive force measurements. In the experiment, the formation of spatio-temporal figures can also be observed. A model of reaction mechanism to accurately reproduce the oscillations is discussed.

2. Potentiometric and Voltammetric Study of the pair ferricyanide/ferrocyanide in aqueous potassium chloride solution.

The experiment focuses on the electrochemical behaviour of anion ferricyanide in aqueous potassium chloride solution using cyclic voltammetry and potentiometry.

3. Fluorescence spectroscopy. Study of the effect of the molecular structure in the capacity of fluorescent dyes and the transfer of energy of excited molecules of riboflavin

In the first part of the experiment, we obtain the fluorescence, absorption and excitation spectra of a series of dyes from the same family; the intensity of fluorescence will be related to the molecular structure. In the second part, the energy transfer from an excited molecule (riboflavin) to another non-excited (IK) will be analysed.

**4. Determination of the surface tension of hydro-alcoholic mixtures**

The experiment focuses on the measurement of the surface tension of binary mixtures of an alcohol and water. An equation relating the surface tension with the concentration of alcohol in aqueous solution is established and used for the determination of the surface excess concentration of alcohol.

5. Kinetic study of the triphenylphosphine photochemical oxidation

A kinetic study of the photochemical oxidation of triphenylphosphine in organic medium is performed by measuring the remaining fraction of triphenylphosphine using reverse phase HPLC chromatography.

6. Kinetic theory of gases. Measurement of the viscosity of a gas, estimate of the molecular diameter and determination of the molecular mass

The diameter and the molecular mass of two gases are estimated from the viscosity and the mass by applying the kinetic theory of gases.

7. Quantum Chemical calculations: I-Geometric and electronic structures. II-Electronic spectra.

The main methods for semi-empirical calculations are introduced. The methods are applied to a set of molecules of the family of alkanes, alkenes, and aromatic systems. The geometric and electronic structures of the molecules are determined and the absorption spectra are computed.

8. Study of electronic systems with the Hückel method

The aim of the study is to familiarise students with the method of molecular orbitals constructed as a linear combination of atomic orbitals (MO-LCAO). To achieve such goal the Hückel method is used because of its simplicity.

9. Molecular modeling: structure and reactivity

The study aims to familiarise students with the following concepts: potential energy surface, local minimum, global minimum, saddle point, barrier of potential, optimisation of the geometry, internal coordinates, field of forces, and molecular mechanics.

10. Parker actinometer

The experiment involves the assembly and calibration of the Parker actinometer.

**WORKLOAD**

ACTIVITY	Hours	% To be attended
Laboratory practices	48,00	100
Tutorials	12,00	100
Development of group work	6,00	0
Development of individual work	20,00	0
Study and independent work	24,00	0
Readings supplementary material	6,00	0
Preparation of evaluation activities	20,00	0
Preparation of practical classes and problem	14,00	0
TOTAL	150,00	

TEACHING METHODOLOGY

The following methodologies will be applied to the course:

- Lectures
- Practical classes
- Data processing, calculations, and resolution of questions
- Information search

The students will have available in advance an explanatory text for each experiment or computational study, which may be downloaded from the web page of the teaching laboratories of the Department of Physical Chemistry. There you will find general information about how to work in the laboratory, educational materials, and links of interest that may be consulted at any time.

Each student will have 60 classroom hours in the dates and hours laid down in the tender of Academic Course (OCA). During this time, the following educational activities will be carried out: 6 experimental/computational works, 2 seminars devoted to activities related to the acquisition of transferable skills, and 1 session for evaluation, all distributed in 15 sessions of 4 hours each one.

The experiments or computational studies are organized in groups of two with 4 sessions devoted to each of the groups as follows:

Session 1: Explanation of the two experiments.

Session 2: Realization of the first experiment.

Session 3: Realization of the second experiment.

Session 4: Calculations and questions about both experiments in the computer classroom.

The six experiences scheduled will be carried out in twelve sessions. Two more sessions will be devoted to seminars and the last one will be used for evaluation.

The course is organized into the following items:

1. Preparatory session

Each experiment has a few specific objectives which are described in the corresponding explanatory text, as well as the recommended literature to use for its preparation. Before the practical session, students must read carefully the text, prepare an outline of the experimental procedure, answer the questions raised, and do the calculations necessary to make the experiment.

2. Practical work.

The practical work will be carried out in pairs and in some cases the results will be shared by all the students, which can help to enhance teamwork.

The students should write all the experimental data and measurements in their workbooks while they are working in the laboratory.

3. Calculations and discussion of results.

The students will start to do the calculations in the laboratory. Furthermore, they should analyze the experimental results obtained in the laboratory as well as previous calculations, and express the results with appropriate units and significant figures. Therefore, this stage aims to develop the capacity for analysis of the student.

4. Laboratory notebook.

The students should keep up to date the laboratory notebook. The teacher will periodically review the notebook, and the student will submit it at the end of the course within the deadline set by the teacher.

5. Report of the experiments or computational studies.

One goal of this course is that students become familiar with the writing of a scientific work. To achieve such goal, each student will present a manuscript about one of the experiments or computational studies carried out in the course which will be assigned by the teacher. This work will be performed individually and submitted by the deadline set by the teacher.

6. Seminars.

The students will be instructed about searching bibliographic information and the use of databases. The results, experimental techniques, and computational methods used in the course will be discussed.

EVALUATION

Attendance to all sessions is compulsory. To pass the course the student must attend at least 90% of the seminars and laboratory sessions. The evaluation of learning will be individual and will be held according to the following criteria:

1. Continuously assessed work, based on classroom activities, participation and involvement of the student in the teaching-learning process during the laboratory sessions: attitude, skills acquired, and laboratory notebook: 30% of the overall mark.
2. Theoretical and practical tests consisting of oral and/or written examinations which shall include both theoretical and practical questions and problems: 40% of the overall mark.
3. Presentation of the results: reports, and/or oral communication: 30% of the overall mark.

FIRST CALL

The evaluation will be done by the average of the three sets of evaluation indicated above. To pass the course, you must obtain a minimum of 5.0 for the overall mark; in addition, in each of the items, you must achieve a minimum mark of 4.0 out of 10.

SECOND CALL

In the second call, the students will be able to do again the theoretical and practical tests and presentation of results, namely the examination and report.

The evaluation will take place following the same weighting criteria as in the first call.

ADDENDUM COVID-19

This addendum will only be activated if the health situation requires so and with the prior agreement of the Governing Council

Contents

- 1.- The contents initially indicated in the teaching guide are maintained.

Workload and temporary teaching planning

Regarding the workload:

- 1.- The different activities described in the Teaching Guide are maintained with the intended dedication.

Regarding the temporary teaching planning:

1.- The material to follow the theory/tutoring/classroom-seminar classes allows to continue the temporary teaching planning both in days and schedule, whether the teaching is face-to-face in the classroom or not.

Teaching Methodology

Laboratory courses: Regarding laboratory courses, the maximum face-to-face teaching will be lying in compliance with the rules of distance and occupation of spaces fixed by the academic authorities. In this sense, the teaching type "L" will be 100% face-to-face, and the teaching type "U" will be non-face-to-face and will be taught through the tools offered by the virtual classroom.

The methodology used for non-face-to-face classes shall be:

1. Synchronously using virtual classroom tools (preferably Teams or Blackboard)
2. Asynchronously using presentations with audio narration or other virtual classroom tools
3. Resolution of exercises and questionnaires

If there is a closure of the facilities for health reasons that totally or partially affects the classes of the course, they will be replaced by non-face-to-face sessions following the established schedules and using the tools of the virtual classroom.

In the case of students confined to home due to COVID, as far as possible, the experimental sessions will be recovered and they will be ensured on-line teaching through Teams or Blackboard.

Evaluation

1. The evaluation system described in the Teaching Guide of the subject in which the various evaluable activities have been specified as well as their contribution to the final grade of the subject is maintained.

If there is a closure of the facilities for health reasons affecting the development of any face-to-face evaluable activity of the subject, it will be replaced by a test of a similar nature that will be carried out in virtual mode using the computer tools licensed by the University of Valencia. The contribution of each evaluable activity to the final grade of the subject will remain unchanged, as set out in this guide.

References

- 1.- The literature recommended in the Teaching Guide is maintained since it is accessible.

If there is a closure of the facilities for health reasons, the basic recommended bibliography will be replaced by the Atkins and the Levine textbooks, originally included in the course guide as complementary bibliography, since they can be on-line accessed. Teachers may make their own material available to students.
