

**COURSE DATA****Data Subject**

<b>Code</b>	34296
<b>Name</b>	Mechanisms and models of vision
<b>Cycle</b>	Grade
<b>ECTS Credits</b>	6.0
<b>Academic year</b>	2018 - 2019

**Study (s)**

<b>Degree</b>	<b>Center</b>	<b>Acad. year</b>	<b>Period</b>
1207 - Degree in Optics and Optometry	Faculty of Physics	3	First term

**Subject-matter**

<b>Degree</b>	<b>Subject-matter</b>	<b>Character</b>
1207 - Degree in Optics and Optometry	11 - Visual perception II	Obligatory

**Coordination**

<b>Name</b>	<b>Department</b>
CAPILLA PEREA, PASCUAL	280 - Optics and Optometry and Vision Sciences

**SUMMARY**

The subject of Mechanisms and Models of Vision, part of the matter “Visual Perception”, aims to study the neural mechanisms involved in visual perception and the simpler models quantitatively describing the vision of color, shape and movement. The models that will be studied are only linear models that use low level mechanisms (that is, up to the striate cortex).

**PREVIOUS KNOWLEDGE****Relationship to other subjects of the same degree**

There are no specified enrollment restrictions with other subjects of the curriculum.

### Other requirements

Previous knowledge of Psychophysics of Vision is required, as well as an elementary knowledge of the anatomy and physiology of the visual system.

## OUTCOMES

### 1207 - Degree in Optics and Optometry

- To have and to understand the fundamentals of Optometry for its correct clinical and healthcare application.
- Knowing how to apply the knowledge acquired to professional activity, knowing how to solve problems and develop and defend arguments.
- Being able to gather and interpret relevant data to make judgments.
- Being able to transmit information, ideas, problems and solutions to both a specialized and non-specialized audience.
- Development of learning skills necessary to undertake further studies with a high degree of autonomy.
- To know the basic models of vision.
- To know the spatial and temporal aspects of vision.
- To know how to correlate psychophysical experiments with the physiology of the visual system.
- To know and to apply Fourier theory to vision models.
- To know the basic models of color, shape and movement vision.
- To know the spatial and temporal chromatic aspects of vision.

## LEARNING OUTCOMES

Learning outcomes should be consistent with each and every one of the specific skills listed in the previous section.

## DESCRIPTION OF CONTENTS

### 1. Introduction.

#### The dimensions of the visual perception

## **2. Neural Basis of vision.**

Architecture of the visual system.  
Functional specialization of the visual pathways  
The retina, LGN and the visual pathways  
The striate cortex

## **3. Color vision.**

Models of color vision I. Trichromatic theory.  
Models of color vision II. Chromatic and achromatic mechanisms.  
On the physiological mechanisms of color vision.

## **4. Spatial vision.**

Spatial limits of vision.  
Contrast sensitivity.  
The visual system as a frequency filter.  
The visual system as a discrete set of filters.  
On the physiological mechanisms of spatial vision.

## **5. Temporal properties of the visual system and motion perception.**

Analysis of the motion by the visual system.  
Limits of vision in the spatio-temporal domain .  
Models of the visual system in the spatio-temporal domain.

## **6. Mandatory seminars**

S1.-Peceptual descriptors of the color.  
S2.- Linear spaces for color representation.  
S3.-Numerical characterizations of differential stimuli: the opponent-modulation space.  
S4.-Spectral decomposition of a visual scene.

**WORKLOAD**

ACTIVITY	Hours	% To be attended
Theory classes	30,00	100
Tutorials	15,00	100
Laboratory practices	15,00	100
Development of group work	10,00	0
Development of individual work	20,00	0
Study and independent work	25,00	0
Readings supplementary material	5,00	0
Preparation of evaluation activities	10,00	0
Preparing lectures	10,00	0
Preparation of practical classes and problem	10,00	0
<b>TOTAL</b>	<b>150,00</b>	

**TEACHING METHODOLOGY**

The course will consist of 3 different class types with different methodology: (i) Theory, (ii) seminars and supervised work, (iii) laboratory practical classes.

In classes of type (i) the basic theoretical content of the course will be taught and the psychophysical experiments that illustrate such content will be discussed. To increase the presentation / assimilation ratio, a video projector will be used to display graphs, pictures, animations and films, combined with discussions / presentations on the board. Also simple demonstrations will be carried out. It will encourage and guide students to the expansion of content received in each class through the recommended reading, and the possibility of expansion of their knowledge in future courses.

Type (ii) classes include two types of activities: 1) seminars on specific topics additional to the program; to the end of the talk there will be a corresponding space for dialogue, 2) problems will be proposed to be performed at the classroom or at home individually or in pairs, whose results will be partially exposed and discussed in the classes.

Finally, in the type (iii) classes, a set of experimental demonstrations of the different characteristics of vision will be carried out in the laboratory, using the appropriate psychophysical methods in each case. Following the completion of each practical session, it will be necessary to submit a form with the results and conclusions. Students should also write a detailed report of one of the practical sessions.

## EVALUATION

Evaluation of the course:

The evaluation of the subject will be done with the following criteria (about 10 points):

- A) 6 points: for a written exam, with theoretical-practical questions.
- B) 2 points: for the problems proposed and made by the student during the course, as continuous evaluation.
- C) 2 points: for the memories of the work done in the laboratory.

The required qualification to pass the subject will be 5 points, with the requirement to obtain a minimum of 40% of the maximum attainable in each of the sections. The deadlines for the delivery of problems will be fixed with sufficient time in advance. Students who have not delivered the problems solved, in the established dates, or have not passed the court note, will be entitled to a problem examination in the second call.

Attendance at laboratory sessions is mandatory.

The reports of the practices must be delivered on the date established at the beginning of the course. Students who have not delivered the reports, or have not passed the court note, will be entitled to a practice exam in the second call.
