SUMMARY

Management Act Health Professions (LOPS 44/2003 of November 21) recognizes the Podiatry as a profession in equal status with other health disciplines but with distinct characteristics.

Podiatry graduates whose main function is the diagnosis and treatment of diseases and deformities of the feet, through therapeutic techniques specific to their discipline.

In the same way that all health professions, the methodology used in the diagnosis and treatment will follow the scientific method steps: Data collection, Diagnosis, Planning, Intervention and Evaluation.

The management of the health professions also requires widening the scope of responsibilities to more generic issues, such as disease prevention, health promotion, maintenance of health and recovery and rehabilitation.

This health perspective, requires a vision of human beings in a more global understanding it as a bio-psycho-social, which extends the practice away from the dominant reductionist views to date.

The podiatrist future thus becomes a health professional whose role goes far beyond mere concern of foot function and physical changes for a more complete view of the human being understood as a unit, detects changes to all levels, biological, psychological and social.

This understanding of podiatry requires any knowledge in these areas. Since the subject we propose in this guide the ultimate goal is to impart knowledge about the way we humans perceive the world around us and interact with it, and the forms of disease of mental processes and psychiatric disorders consequent

From this perspective we have built the guide that follows, taking into account aspects such as the evolution of mental processes in the development life cycle and gender differences.

The subject program is divided into 5 sections:

The first section is introductory and the reviews the basic concepts and methodologies of science in the field of psychosocial health, biopsychosocial nature of the behavioral and psychosocial aspects that characterize the different stages of life cycle.

The second section will develop a more specific way of development of basic psychological processes and which will include signs and symptoms of psychiatric disorders that make up each of these processes.

The third section will review the psychosocial factors related to health behavior and disease, focusing on aspects related to stress, pain and treatment adherence.

The fourth section includes a theoretical approach from relational and therapeutic techniques that the student must acquire for Chiropody establish a satisfactory and effective relationship with patients, family and community. This section will also include the most frequently used techniques for emotional self-control and relaxation, we consider basic for any healthcare professional.

The fifth section introduces more specifically the content that support the theoretical framework in Mental Health for the sixth section focus on the detection and management of people with serious mental health problems and less severe, as well as their involvement with the family. Psychiatric disorders that are taught in this section follow the taxonomic categorization proposed by the DSM-V, and focus on mood disorders, schizophrenic disorders, anxiety disorders and eating disorders.

PREVIOUS KNOWLEDGE

Relationship to other subjects of the same degree

There are no specified enrollment restrictions with other subjects of the curriculum.

Other requirements

No se requieren conocimientos previos.
