**SUMMARY**

This course "Project Management" is part of the subject "Software Engineering and Project Management". Its general objective is that students gain the ability to properly apply all previously acquired knowledge to the design, development and evaluation of projects and reports in the field of Computer Engineering, applying the methodology and the basic principles of economics, management, auditing and business organization. It is a compulsory subject that is taught quarterly basis in the third year of the degree of Computer Engineering in the second quarter. The curriculum consists of a total of 6 ECTS.

In general terms, the objectives of the course are:

- Primarily, to enable students to successfully face the real project management of any type within the computer industry and to a large extent, information technology and communications (ICT).
- Know the general theory of project management and the reasons against judicial management within an IT organization.
- Introduce the concept of Information Systems Plan, from the perspective of strategic plan computer within an organization and its relationship with project management.
- To know the different phases of the life cycle of a computer project.
- To understand the features that should have documentation of a project, technical report and the presentation and defense of a project.
- Know the technical feasibility ICT projects.
- Learn the techniques of economic evaluation of projects in the field of Computer Engineering.
- Learn the techniques of planning and project control.
- Understand the relationship between the technical aspects to be addressed in a draft plan and information systems of an organization.
- To present the basic elements of an audit of IT projects and their difference from the computer internal control methodologies

From the educational point of view, the subject has a practical approach and is primarily focused on the development of practical skills for the engineer who must use their professional development as a project manager, or as part of the project team. In achieving the above objectives, the student must have acquired a number of skills related to management of both material and human resources in the planning and implementation of any ICT project.

## PREVIOUS KNOWLEDGE

### Relationship to other subjects of the same degree

There are no specified enrollment restrictions with other subjects of the curriculum.

### Other requirements

The course, given its general nature, does not need a specific background, although it is recommended to have attended the courses Engineering, Society, University and Business, in order to have an initial perception of the world of a Company. On the contrary, it does provide very direct connections in those subjects in which the work is embodied in a project such as Software Engineering I and Software Engineering II.

## OUTCOMES

### 1400 - Degree in Computer Engineering

- G1 - Ability to design, write, organise, plan, develop and sign projects in the field of computer engineering aimed at the design, development or exploitation of computer systems, services and applications.
- G2 - Ability to lead project activities in the field of information technology, in accordance with both the knowledge and the specific skills acquired in the degree.
- G3 - Ability to design, develop, evaluate and ensure the accessibility, ergonomics, usability and security of computer systems, services and applications, and of the information that these manage.
- G4 - Ability to define, evaluate and select hardware and software platforms for the development and implementation of computer systems, services and applications, in accordance with both the knowledge and the specific skills acquired in the degree.
- G5 - Ability to design, develop and maintain computer systems, services and applications using software engineering methods as an instrument for quality assurance, in accordance with both the knowledge and the specific skills acquired in the degree.
- G6 - Ability to design and develop computer systems and centralised or distributed computer architectures which integrate hardware, software and networks, in accordance with both the knowledge and the specific skills acquired in the degree.
- G9 - Ability to solve problems with initiative, decision making, autonomy and creativity. Ability to communicate and transmit the knowledge, skills and abilities of a computer engineer.
- G10 - Knowledge to perform measurements, calculations, assessments, appraisals, surveys, studies, reports, scheduling and other similar work in the field of computer engineering, in accordance with both the knowledge and the specific skills acquired in the degree.
- G12 - Knowledge and application of the basic principles of economics and human resource management, project organisation and planning, and legislation, regulation and standardisation in the field of computer projects, in accordance with both the knowledge and the specific skills acquired in the degree.
- R1 - Ability to design, develop, select and evaluate computer applications and systems while ensuring their reliability, safety and quality, according to ethical principles and current legislation and regulations.
- R2 - Ability to plan, design, implement and manage computer projects, services and systems in all areas, leading their implementation and continuous improvement by assessing their economic and social impact.
- R3 - Ability to understand the importance of negotiation, effective work habits, leadership and communication skills in all software development environments.
- R4 - Ability to draw up the technical specifications of a computer system, according to standards and regulations.

- TI2 - Ability to select, design, implement, integrate, evaluate, build, manage, exploit and maintain hardware, software and network technologies, within adequate cost and quality thresholds.
- TI3 - Ability to use user-centred and organisation-centred methodologies for the development, assessment and management of IT-based applications and systems, to ensure accessibility, ergonomics and usability.
- TI6 - Ability to design systems, applications and services based on network technologies, including the Internet, the web, e-commerce, multimedia, interactive services and mobile computing.
- SI3 - Ability to actively participate in the specification, design, implementation and maintenance of information and communication systems.

## LEARNING OUTCOMES

The content of this subject aims to achieve the following learning outcomes:

- To apply methodologies for the development, implementation and maintenance of information systems.
- Plan and execute iterative software development processes correctly
- Knowing to apply software design patterns in each situation depending on the needs of the software development project
- Define validation testing and requirements verification
- Get user and software requirements
- To understand the improvements that a business-based management and of production based on projects against a methodology of continuous type
- Know, differentiate and write the different documents that are usually handled during the management and life of a project
- Analyze the basics of project management
- Develop basic skills (techniques and tools) in the planning and execution of projects
- Estimate costs, times and resources in a project
- Develop and present technical documentation of projects in English

## DESCRIPTION OF CONTENTS

### 1. An introduction to the Project Management

- 1.1 Introduction to the theory of project
- 1.2 Phases of a project and areas of expertise
- 1.3 Management of scope
- 1.4 Time management
- 1.5 Cost Management
- 1.6 Risk Management
- 1.7 Management of resources

## **2. Agile methodologies: SCRUM**

- 2.1 Introduction
- 2.2 SCRUM methodology
- 2.3 Agile Project Management
- 2.4 Case Study

## **3. Scope management**

- 3.1. Introduction to project scope
- 3.2. Phases of a project:
  - 3.2.1. Home Project
  - 3.2.2. Project definition
  - 3.2.3. Project Planning
  - 3.2.4. Verification of project
  - 3.2.5. Control of project changes

## **4. Time management**

- 4.1. The context of the Planning Projects
- 4.2. Time Management in Projects
  - 4.2.1. Defining Activities
  - 4.2.2. Sequencing of Activities
  - 4.2.3. Estimated length of Activities
  - 4.2.4. Development Management Plan Temporary
  - 4.2.5. Temporal Control Management Plan

## **5. Cost management**

- 5.1. Introduction
- 5.2. Cost Planning
- 5.3. Cost Estimating
- 5.4. Budget Estimating
- 5.5. Control of costs

## **6. Risk management**

- 6.1. Certainty, risk and uncertainty
- 6.2. The risk throughout the life cycle of a project
- 6.3. Phases of Risk Management
- 6.4. Quantification of risk

## **7. Resource Management**

- 7.1. Introduction to Resource Management
- 7.2. Activities of Resource Management:
  - 7.2.1. Human Resource Plan
  - 7.2.2. Acquisition of the project team
  - 7.2.3. Development of the project team
  - 7.2.4. Address of the project team
- 7.3. Human Resource Management

## **8. Control and monitoring of the project**

- 8.1. The control processes
- 8.2. procedures involved
  - 8.2.1. Control and status reports
  - 8.2.2. Management changes and problems

## **9. Economic aspects of a project**

- 9.1. The economic engineering. Definition
- 9.2. Financial criteria for evaluating: Analysis in the preliminary stages of the project
- 9.3. Financial criteria for evaluating: Analysis in advanced stages of the project (VAN & TIR)

## **10. Degree Project Documentation**

- 10.1. Introduction.
- 10.2. Types of projects.
- 10.3. Structure of the Thesis
- 10.4. Standard errors of DP
- 10.5. Evaluation

**WORKLOAD**

ACTIVITY	Hours	% To be attended
Theory classes	30,00	100
Laboratory practices	20,00	100
Classroom practices	10,00	100
Attendance at events and external activities	3,00	0
Development of group work	15,00	0
Development of individual work	10,00	0
Study and independent work	10,00	0
Readings supplementary material	5,00	0
Preparation of evaluation activities	15,00	0
Preparing lectures	10,00	0
Preparation of practical classes and problem	12,00	0
Resolution of case studies	10,00	0
<b>TOTAL</b>	<b>150,00</b>	

**TEACHING METHODOLOGY**

The development of the course is structured around four pillars: learning with the teacher (theory sessions, problems and tutorials), seminars, workshops, laboratory sessions and completion of a project meeting all stages from the planning stage to the ultimate realization of the project document.

**Group learning with the teacher**

In the theory sessions will use the lecture model. In them the teacher will present the main contents of the course, using the media at your fingertips (presentations, transparencies, blackboard).

In the session problems, the teacher will explain a number of problems-type corresponding to items 5 and 6, through which the students learn to conduct economic feasibility studies and operating accounts (item 5) and obtain the schedule implementation of a project (item 6). Participatory approach will be used for such meetings, which is to prioritize the communication between students and student / teacher. To do this, tell the teacher beforehand what day will be dedicated to solving problems and what problems could be solved, so that the student attends these classes with the approach of the problems prepared in advance. Its resolution will be completed in class in groups of four or five students who then must go to the blackboard to explain the problem and resolve the doubts that have the other fellow.

### **Seminar-workshop (group work in problem sessions)**

The theoretical concepts introduced in lectures will be complemented by conducting a series of seminar-workshops. These seminars will address topics such as systems development methodology of information-oriented government (Metric 3), professional associations in Multimedia, professionalization of the post of project manager, etc.. These seminars will be prepared for all the students organized in small groups (2-4 students). The teacher will select one group, at its option, to be submitted and after the exhibition, there will be a question and discussion by the teacher and other students. Both the exposure and involvement in class the other partners will be considered for final evaluation.

Additionally, the teacher will teach a seminar on final projects and training practices in Computer Engineering. Attendance at this seminar is mandatory, and students must make a summary of the above, you will finally have its value in the final grade for the course.

### **Laboratory sessions**

Laboratory sessions are aimed at:

- Learning and management of project management tools both commercial (Microsoft Project) and free distribution (GranttProj).
- Make a spreadsheet like Microsoft Excel, to represent the scope of a project (EDT / WBS) and the study of their own operational and economic viability.

You are laboratory sessions will be organized around working groups of a maximum of two people.

### **Completion of a project (group work)**

The same groups that were formed for conducting the workshop seminars (from 2 to 4 students), should prepare a project to address content included in any of the knowledge areas included within the scope of Multimedia Engineering fulfilling all its stages, from the planning stage to the ultimate realization of the project document and presentation. The planning of this project will be using the tool MS Project (or similar) seen in the lab sessions, and a description of the range (EDT / WBS) and an economic study based on type EXCEL spreadsheet (or similar).

On the other hand, following a development based on traditional life cycle of systems development, each team must prepare the project documentation in 4 parts: memory, specifications, budgets and basic block diagram of the alternative proposal.

At the end of the semester, each team must provide a copy of your project and also must present and defend it. Excluded from the need for exposure of work, but not the presentation of documentation, those students who already made the presentation for one of the topics covered in the seminar-workshop.

### **Office Hours**

The students have a schedule of tutorials aimed at solving the problems, doubts, work orientation, etc.. The schedule of these office hours will be indicated at the beginning of the academic year. They will also have the opportunity to clarify some questions via email or discussion forums by using the tool "Virtual Classroom", which gives the University of Valencia.

## **EVALUATION**

Knowledge assessment will be done in two ways:

### **1) CONTINUOUS EVALUATION**

Recommended method for students. The following factors are evaluated to obtain the final mark:

- 55% theoretical knowledge and problems (TEO).
- 25% of the laboratory (LAB)
- 20% of additional work (ART)

To be able to average it is necessary to obtain a minimum grade of 4,5 in each one of the parts, being necessary that the final note is equal to or superior to 5 to approve.

#### **a) Theoretical knowledge and problems (TEO).**

The note of theoretical knowledge and problems are assessed according to the following factors:

- **90% OF INDIVIDUAL TESTS OBJECTIVES.** During the course there will be different written tests on theoretical knowledge and problems. It will be necessary to get a grade of 4 or higher in each test so that you can compensate. In the final examination of the first call, those parts that have not been passed in the partial tests will have to be recovered.
- **10% OF PROBLEMS.** We will evaluate the different problems that are proposed to the students, either to perform in class or at home. This activity is not recoverable.

**b) Laboratory (LAB).**

The laboratory grade will be obtained by averaging the grade obtained in the N practical sessions. In order to obtain the grade of the laboratory it will be necessary to have presented all the practices and to have attended a minimum 80% of the classes.

**c) Additional works (TRA).**

The note of additional works will be obtained by averaging the grades obtained in each of the works by the weight assigned to each one. It will be necessary to obtain a mark of 4,5 or more in each work so that this part can be compensated.

The note of each work will be obtained in function of the written memory, and optionally it will be possible to value the public exhibition of the work done.

**2) SINGLE EVALUATION SYSTEM AND SECOND CALL**

This method will apply to any student who, for a reason reasoned and admitted by the teacher, can not attend regularly to classes and in the second call.

The following factors are evaluated to obtain the final mark:

- 55% theoretical knowledge and problems (TEO).
- 25% of the laboratory (LAB)
- 20% of additional work (ART)

To be able to average it is necessary to obtain a minimum grade of 4,5 in each one of the parts, being necessary that the final note is equal to or superior to 5 to approve.

**a) Theoretical knowledge and problems (TEO).**

The note of theoretical knowledge and problems are assessed by a single examination, not taking into account other factors such as attendance or problem exercises performed during the course.

**b) Laboratory (LAB).**

The laboratory grade will be obtained by averaging the grade obtained in the practical sessions, which must have been delivered, even if you have not attended the laboratory sessions.

**c) Additional works (TRA).**

The note of additional works will be obtained by averaging the grades obtained in each of the works by the weight assigned to each one. It will be necessary to obtain a mark of 4,5 or more in each work so that this part can be compensated.

The student must have submitted all the papers to approve, and only the part of the written report will be evaluated.
