SUMMARY

The subject "Sensoriality" is a compulsory subject of third year of the Degree of Gastronomic Sciences, which is taught in the Faculty of Pharmacy of the University of Valencia. This course has a total of 6 ECTS credits to be taught in the first semester.

With this subject is intended that the student would be able to conduct a tasting of any food. To do this, the basic concepts on fundamental aspects of sensory analysis, such as the physiological mechanisms involved, definitions, among others, and their importance as a quality parameter in food will be given. In addition, the standardized conditions for the tests and the types of tests that exist will be studied, and the adequate conditions depending on the purpose to be achieved, for which the most used sensory tests will be analyzed.

PREVIOUS KNOWLEDGE

Relationship to other subjects of the same degree

There are no specified enrollment restrictions with other subjects of the curriculum.

Other requirements

OUTCOMES

1212 - Degree in Gastronomic Sciences

- Students must have the ability to gather and interpret relevant data (usually in their field of study) to make judgements that take relevant social, scientific or ethical issues into consideration.
- Students must be able to communicate information, ideas, problems and solutions to both expert and lay audiences.
- Students must have developed the learning skills needed to undertake further study with a high degree of autonomy.
- Have knowledge and understanding in the field of gastronomic sciences.
- Learn the fundamentals for using the scientific equipment directly related to professional activity.
- Be able to engage in new fields of gastronomy in general through independent study.
- Be able to work in a team and to organise and plan activities, always taking account of gender perspective.
- Be able to construct an understandable and organised written text.
- Prepare and handle the writings, reports and action procedures best suited to the problems raised, using non-sexist language.
- Be able to take the approaches required to reduce a problem to a manageable level.
- Know the general concepts and theoretical principles of food sensory analysis and understand the basic aspects of sensory perception such as the physiology of the senses and sensory properties of food.
- Acquire skills for the analysis and interpretation of sensory evaluation results and the application of the statistical analysis appropriate to each experimental design.

LEARNING OUTCOMES

- To design the different sensory tests according to the proposed objectives.
- To know the correlation between the different physical and sensorial properties of food.

- Elaborate final reports from the analysis of sensory and instrumental data.

DESCRIPTION OF CONTENTS

1. INTRODUCTION TO SENSORY ANALYSIS

Definition.
Fields of application.
Historical evolution of the discipline.
Related areas.
Sensory and instrumental measurements.

2. HUMAN SENSES AND SENSORY PERCEPTION

The sight, the smell, the taste, the touch and the ear.
Sensory properties.
The taste perception.
The gustatory stimulus.
Sensory perception.
The senses, the stimuli and the sensations.
Sensorial thresholds.
Calculation of individual and collective thresholds.
Best estimated threshold.

3. REGULATION AND STANDARDIZATION

The Tasting Room.
Environmental requirements.
Tasting booths.
Utensils for sensory tests.
Disposable material.
Standardized utensils.

4. METHODOLOGY OF TASTING

Methodology of tasting

5. SENSORY TESTS

General scheme.

Approach of the sensorial test: objective and characteristics of the samples.

Sensory test planning.

Conduct of the test.

Use of reference samples.

More frequent errors in sensory responses.

6. TYPES OF PANELS

The panel of tasters: recruitment, training, validation and maintenance.

Standard Sheets.

Blind tasting.

7. PROCESSING OF RESULTS

Introduction to statistics for sensory analysis.

Hypothesis test.

Binomial test.

Types of tests.

Preparation of reports.

8. FOOD WITH MESSAGE. NEUROGASTRONOMY

Perception of the consumer. Motivation in choice and sensation. Phenomena of adaptation and masking.

Factors that influence the sensory response. Psychophysical laws.

9. MICROORGANISMS

Microorganisms related to sensory characteristics in specific products.

WORKLOAD

ACTIVITY	Hours	% To be attended
Other activities	30,00	100
Theory classes	15,00	100
Laboratory practices	15,00	100
Preparing lectures	45,00	0
Preparation of practical classes and problem	45,00	0
TOTAL	150,00	

TEACHING METHODOLOGY

The **theoretical** teaching methodology will be based on the delivery of lectures along with the possible performance, presentation and defense of individual and collective reports. Classes are taught using audio-visual technical equipment. The student will have this material in the virtual classroom.

The **practice sessions** will be conducted in a laboratory, where students can extend and implement the knowledge. He/She distributed a booklet of practices with the necessary materials and the development of each of the perfectly organized practices. The teacher will monitor the practice, will address the doubts in the implementation and provide guidance on how to make reports, organizing results and conclusions. At the end of the internship, the teacher will distribute a series of questions that students will develop and deliver to the teacher within a certain time. In classroom practical classes problem and cases will be resolved.

Seminars will be used to enhance teamwork and improve oral presentation, by performing theoretical and practical training to complement that is acquired in class work, and also for another series of complementary activities types varied.

Visits to centers of interest for the subject will be scheduled. At the end of the visit, a report will be delivered to the teacher.

During the activities, examples of the applications of the contents of the subject in relation to the Sustainable Development Goals (SDGs) will be indicated, and topics will be proposed for the seminars. This is intended to provide to the student knowledge, skills and motivation to understand and address these SDGs, while promoting reflection and criticism.

EVALUATION

Written test to ensure knowledge and understanding of established theoretical minimum content for the subject (60%). The written test will include questions about theoretical sessions and classroom practical classes.

Seminars will be evaluated with the possible implementation, presentation and defense of individual and group reports on topics related to the contents explained and discussed in the classroom during the theoretical classes, classroom practical classes, seminars or visits. The level of understanding of content and skills to their exposure, advocacy and discussion will be appreciated (10%)

Assessment of **practice sessions** work by monitoring the work of the same, the ability to solve experimental problems and the ability to make very detailed and organized reports of experimental results. (20%)

Continuous assessment will consist of assessing the work done during the practical classes, the classroom and the visits, and the ability to solve the proposed activities (10%).

It is necessary to acquire 5 out of 10 points in the written test that includes questions of theory and practice to pass the subject.

Attendance at practices, visits and seminars is mandatory to pass the subject. It is not obligatory for repeaters during the two subsequent courses to its realization.

ADDENDUM COVID-19

This addendum will only be activated if the health situation requires so and with the prior agreement of the Governing Council

VOLUME OF WORK AND TEMPORARY PLANNING OF TEACHING.

75% of hours of theoretical classes that cannot be face-to-face will become non-face-to-face through synchronous videoconference, leaving the rest of the time for the student to organize their autonomous learning with the materials uploaded in the virtual classroom.

The practical sessions that cannot be taught will also be given by videoconference synchronously.

Maintenance of temporary teaching planning both days and hours.

The tutorials will be held through chats and videoconferences at the planned times. In the case of the seminars they will go to non-presential, for which the presentations will be posted in the virtual classroom and short questions will be proposed in this regard by the teacher for their evaluation.

TEACHING METHODOLOGY.

Theory sessions: They will be carried out in person and virtually through videoconferences (Blackboard) for concepts that need clarification and powerpoint presentations, using forums in the virtual classroom to clarify doubts. All the necessary documentation for the monitoring of the classes, as well as specific documentation, will be accessible in the Virtual Classroom of the subject.

Practice sessions: Laboratory practices will be developed in person. In case it cannot be done in person, the remote teaching of the practices will be mixed (synchronous and autonomous work of the student). The practice schedule established in the subject schedule will be maintained. Prior to the practice session, the student must have reviewed the material available on the subject's website where the objective of the course will be detailed, as well as the instructions and tests. to be done in each session. The practice scripts may require previous exercises, video viewing or preparation of material by the student. On the day of the practice, according to what is established in the schedule of the subject, the students will connect to the platform at the date and time established to carry out the activities proposed in the script of the practice.

Group tutoring: All sessions will be face-to-face in small groups, or via virtual if the situation does not allow it.

Seminars: All sessions will be face-to-face or via virtual if the situation does not allow it, in this case the presentations will be posted in the virtual classroom and short questions will be proposed in this regard by the teacher for evaluation.

EVALUATION

Neither the way of evaluating nor the weight of each evaluable part will change with respect to the information referred to in the Teaching Guide of the subject.

In case the theoretical / practical evaluation could not be carried out in person, the evaluation would be done electronically and through the virtual classroom. The theoretical concepts test will be based on a battery of multiple-choice questions, which are generated automatically and randomly from a bank of questions of varying difficulty. After this test, there will be a multiple questions exam that will evaluate the concepts seen in the practical sessions.

The exam will be held on the day and time proposed by the Faculty of Pharmacy. In the event that a student does not have the means to establish this connection and access the virtual classroom, they should contact the teacher.
