

Course Guide 36409 Probability and simulation

COURSE DATA Data Subject 36409 Code Name Probability and simulation Grade Cycle **ECTS Credits** 6.0 Academic year 2023 - 2024 Study (s) Degree Center Acad. Period vear 1406 - Degree in Data Science School of Engineering 1 Second term Subject-matter Subject-matter Character Degree 1406 - Degree in Data Science 2 - Statistics Basic Training Coordination Name Department NAVARRO QUILES, ANA 130 - Statistics and Operational Research

SUMMARY

The theory of probability is the area of mathematics which allows us measuring the uncertainty around us. It is the language which allows Statistics to develop as a science.

The main goal of this subject is to learn the language of probability providing students with the following capacities:

- To understand and use the probability calculus.
- To understand the idea of random variable and random vector.

- To recognise the main probability distributions for continuous and discrete variables as well as its interpretation as a theoretical model for a given population.

- To understand the concept of joint, conditional and marginal distribution.

Course Guide 36409 Probability and simulation

Vniver§itatö́ dValència

- To calculate the main moments associated with a random variable or vector.
- To simulate from a probability distribution (Monte Carlo methods).

PREVIOUS KNOWLEDGE

Relationship to other subjects of the same degree

There are no specified enrollment restrictions with other subjects of the curriculum.

Other requirements

Knowledge of the concepts of function, limit, derivative and integral studied in the subject Mathematical Analysis (cod. 36407)

COMPETENCES (RD 1393/2007) // LEARNING OUTCOMES (RD 822/2021)

1406 - Degree in Data Science

- (CG01) Knowledge of basic subjects and technologies that enable students to learn new methods and technologies, and to provide them with versatility to adapt to new situations.
- (CG04) Ability to work in a multidisciplinary group in a multilingual environment and to communicate, orally and in writing, knowledge, procedures, results and ideas related to data science.
- (CT01) To be able to access (bibliographical) information tools and appropriately use them in the development of their daily tasks.
- (CE09) To methodologically know and apply the concepts and techniques of probability and statistics necessary for the extraction of useful knowledge from data analysis.
- (CE15) Ability to model and analyse the uncertainty in data-based studies, as well as to know how to interpret and contextualise the results obtained.
- (CB2) Students must be able to apply their knowledge to their work or vocation in a professional manner and have acquired the competences required for the preparation and defence of arguments and for problem solving in their field of study.
- (CB5) Students must have developed the learning skills needed to undertake further study with a high degree of autonomy.

LEARNING OUTCOMES (RD 1393/2007) // NO CONTENT (RD 822/2021)

To understand the concepts of uncertainty, randomness and probability. (CG01, CB5, CE15, CE09)

To know how to solve probability calculus problems. (CB2, CB5, CE09, CE15)

To understand the concept of random variable. (CG01, CB2, CB5, CE09, CE15)

To know the most important probability distributions and the calculus of their associated moments, quantiles and probabilities. (CG01, CB2, CB5, CT01, CE09, CE15)

To understand the concept of random vector and its associated probability distributions: joint, marginal and conditional. (CG01, CG04, CB2, CB5, CT01, CE09, CE15)

Simulation of probability distributions related to random variables and approximated calculus of its probabilistic features. (CG01, CG04, CB5, CT01)

DESCRIPTION OF CONTENTS

1. Introduction to probability

History of probability Experiments and events Definition and axioms of probability Total probability theorem Conditional probability Bayes Theorem

2. Random variables and probability function

Definition of random variable Types of random variables Probability density function Cumulative distribution function Moments of a random variable

3. Main probability distributions

Bernoulli and binomial density functions Hypergeometric density function Poisson density function Negative binomial density function Normal distribution Law of large numbers Central limit theorem Density functions from the normal distribution (chi-Squared, t-student) Exponential, gamma and beta density functions

Course Guide 36409 Probability and simulation

Vniver§itatö́ dīValència

4. Random vectors

Definition of random vector Joint, conditional and marginal density function. Covariance and correlation

5. Simulation and Monte Carlo methods

Monte Carlo methods Introduction to Markov chains Introduction to Markov Chain Monte Carlo methods.

WORKLOAD

ACTIVITY	Hours	% To be attended	
Theory classes	32,00	100	
Laboratory practices	20,00	100	
Classroom practices	8,00	100	
Attendance at events and external activities	2,00	0	
Development of group work	10,00	0	
Development of individual work	5,00	0	
Study and independent work	20,00	0	
Readings supplementary material	5,00	0	
Preparation of evaluation activities	10,00	0	
Preparing lectures	20,00	0	
Preparation of practical classes and problem	10,00	0	
Resolution of case studies	5,00	0	
Resolution of online questionnaires	3,00	0	
τοτΑ	AL 150,00		

TEACHING METHODOLOGY

MD1 – Theoretical activities: Exposition of the concepts with the enrollment of the student by solving specific questions. Completion of individual evaluation questionnaires. (GC01, CB5, CE09)

MD2 – Practical activities. Learning by solving problems, exercises and case studies through which competences are acquired on the different aspects of the subject. (CB2, CE15)

MD4 - Lab work and / or computer classroom. Learning through the performance of activities developed individually or in small groups and carried out in laboratories and / or computer rooms. (CG04, CT01, CE09, CE15)

EVALUATION

SE1 – Written exam with theoretical and practical questions that will represent 40% of the mark. (GC01, CB5, CE09)

SE2 – Preparation of works and/or a report in PDF, alone and/or in groups, of a report of the issues addressed in the practical sessions. This will represent a 40% of the final mark. The evaluation of this part may be recovered by means of a practical examination that will be carried out on the same date as the theoretical examination of the second call. (CB2, CE15)

SE3 – Continuous evaluation based on the degree of implication of the student in the learning process. This degree of implication can be marked in two different ways between which the student should choose:

i) Oral expositions of the theoretical concepts studied (alone and/or in groups) and problem solving in the classroom (this implies attending the class).

ii) Exercises that students should solve on their own and deliver in the virtual classroom in a given date.

No matter the evaluation process chosen, those activities will not be recoverable and will represent a 20% of the final mark. (CG04, CT01, CE09, CE15).

It will be necessary to get more than 4 in each part to be able to average and more than 5 as final grade to pass.

In any case, the evaluation system would be governed by the *Reglamento de Evaluación y Calificación de la Universitat de València para Grados y Másteres*: https://www.uv.es/graus/normatives/2017_108_Reglament_avaluacio_qualificacio.pdf
