Degree	Subject-matter	Character
1110 - Degree in Chemistry	7 - Physical Chemistry	Obligatory

Coordination

Study (s)

Name Department

VIRUELA MARTIN, PEDRO MANUEL 315 - Physical Chemistry

SUMMARY

With the subject *Physical Chemistry II*, it is intended essentially that students acquire basic knowledge of two fundamental parts of Physical Chemistry, such as Quantum Chemistry and Spectroscopy. Quantum Chemistry is the application of quantum physics to the study of atomic and molecular structure. Spectroscopy can be defined as the study of the interaction of electromagnetic radiation with matter and uses primarily quantum chemistry knowledge. Both subjects are increasingly interdisciplinary, as they are commonly used in other branches of chemistry.

Therefore, this subject will set the foundations for the student to successfully address subsequently the study of different parts of Chemistry and Physical Chemistry itself, usually using the concepts of Quantum Chemistry and Spectroscopy.

PREVIOUS KNOWLEDGE

Relationship to other subjects of the same degree

There are no specified enrollment restrictions with other subjects of the curriculum.

Other requirements

This course has no enrolment requirements with other Degrees courses. In any case, in order to successfully address the subject, it is essential that the student has a prior knowledge, according to the level required in the first year of the Degree in Chemistry. This knowledge comprises:

Basic knowledge of Mechanics and Electromagnetism (Physics I and II).

Basic concepts of Atomic and Molecular Structure (Chemistry I).

Basic concepts of Mathematics, such as: logarithms and exponential management

OUTCOMES

1110 - Degree in Chemistry

- Develop capacity for analysis, synthesis and critical thinking.
- Show inductive and deductive reasoning ability.
- Demonstrate leadership and management skills, entrepreneurship, initiative, creativity, organization, planning, control, leadership, decision making and negotiation.
- Solve problems effectively.
- Demonstrate ability to work in teams both in interdisciplinary teams and in an international context.
- Demonstrate ability to communicate information, ideas, problems and solutions to both specialist and non-specialist audiences and using information technology, as appropriate.
- Demonstrate a commitment to ethics, equality values and social responsibility as a citizen and as a professional.
- Learn autonomously.
- Demonstrate the ability to adapt to new situations.
- Demonstrate knowledge of the main aspects of chemical terminology, nomenclature, conventions and units.
- Interpret the variation of the characteristic properties of chemical elements according to the periodic table.
- Demonstrate knowledge of the principles of quantum mechanics and their application to the description of the structure and properties of atoms and molecules.
- Solve qualitative and quantitative problems following previously developed models.

- Recognise and analyse new problems and plan strategies to solve them.
- Relate theory and experimentation.
- Recognise and evaluate chemical processes in daily life.
- Understand the qualitative and quantitative aspects of chemical problems.
- Students must be able to apply their knowledge to their work or vocation in a professional manner and have acquired the competences required for the preparation and defence of arguments and for problem solving in their field of study.
- Students must have the ability to gather and interpret relevant data (usually in their field of study) to make judgements that take relevant social, scientific or ethical issues into consideration.
- Students must be able to communicate information, ideas, problems and solutions to both expert and lay audiences.
- Students must have developed the learning skills needed to undertake further study with a high degree of autonomy.
- Have basic skills in the use of information and communication technology and properly manage the information obtained.

LEARNING OUTCOMES

The previous section includes the competences contained in the document VERIFICA. This subject addresses part of the learning results of the matter Physical Chemistry that allow to acquire specific knowledge of chemistry, cognitive skills and general skills recommended by the EUROPEAN CHEMISTRY THEMATIC NETWORK (ECTN) for the Chemistry Eurobachelor® Label. The following table lists the learning outcomes acquired in the subject Physical Chemistry II related to the competences of the degree in Chemistry.

SPECIFIC KNOWLEDGE OF CHEMISTRY			
The learning process should allow the degree graduates to demonstrate:			
Major aspects of chemical terminology, nomenclature, conventions and units.	Demonstrate knowledge of the main aspects of chemical terminology, nomenclature, conventions and units(CE1)		
The characteristics of the different states of matter and the theories used to describe them.	Demonstrate knowledge of the characteristics and behaviour of the different states of matter and the theories used to describe them(CE3).		
The principles of quantum	Demonstrate knowledge of the principles of		

mechar	nics and their application to	quantum mechanics and their application to
the des	cription of the structure and	the description of the structure and properties
propert	ies of atoms and molecules	of atoms and molecules(CE5).
		A A A A

COMPETENCES AND COGNITIVE SKILLS The learning process should allow the degree graduates to demonstrate:		
Ability to calculate and process data, related to information and chemistry data.	Solve qualitative and quantitative problems following previously developed models(CE14). Recognise and analyse new problems and plan strategies to solve them(CE15).	

GENERAL COMPETENCES			
The learning process should allow the degree graduates to demonstrate:			
Ability to apply practical knowledge to solve problems related to qualitative and	Solve problems effectively(CG4). Solve qualitative and quantitative problems		

quantitative information.	following previously developed	
Agamama ve miormanon.	models(CE14).	
	Relate theory and experimentation(CE22).	
(0)	Recognise and evaluate chemical processes in daily life(CE23).	
	Understand the qualitative and quantitative aspects of chemical problems(CE24).	
Calculation and arithmetic	Develop capacity for analysis, synthesis and critical thinking (CG1).	
capabilities, including aspects such as analysis error, estimates of orders of magnitude, and correct	Show inductive and deductive reasoning ability(CG2).	
use of the units.	Solve problems effectivelyCG4).	
Planning and time management skills	Develop capacity for analysis, synthesis and critical thinking. (CG1).	
	Demonstrate leadership and management skills, entrepreneurship, initiative, creativity, organization, planning, control, leadership, decision making and negotiation(CG3).	
	Demonstrate ability to work in teams both in interdisciplinary teams and in an international context(CG5).	
	Demonstrate a commitment to ethics, equality values and social responsibility as a citizen and as a professional. (CG7).	
	Express oneself correctly, both orally and in writing, in any of the official languages of the Valencian Community. (CT1).	
	Students must be able to communicate information, ideas, problems and solutions to both expert and lay audiences(CB4).	
	Have basic skills in the use of information and communication technology and properly manage the information obtained.(CT2).	

Study skills necessary for professional development. These will include the ability to work autonomously.

Demonstrate leadership and management skills, entrepreneurship, initiative, creativity, organization, planning, control, leadership, decision making and negotiation..(CG3).

Demonstrate ability to work in teams both in interdisciplinary teams and in an international context..(CG5).

Learn autonomously.(CG8).

Demonstrate the ability to adapt to new situations..(CG9).

Students must have developed the learning skills needed to undertake further study with a high degree of autonomy.(CB5).

DESCRIPTION OF CONTENTS

1. Basic concepts. Principles of Quantum Mechanics

Development of quantum theory. Wave-particle duality. Schrödinger equation. Mathematical formalism. Postulates of Quantum Mechanics. Stationary states. Uncertainty Principle.

2. Model Systems

Translational motion: particle in a one-dimensional box. Particle in a two-dimensional box. Separation of variables technique. Finite tunneling barriers. Vibrational motion: Harmonic Oscillator.

3. Hydrogen Atom

Introduction. Orbital angular momentum. Rigid rotor. Hydrogen Atom: approach to the formal solution of the Schrödinger equation. Energy and functions of the bound states. Spin angular momentum.

4. Many-electron atoms

Many-electron atoms: general approach. Approximate methods. Helium Atom. Orbital approach. Antisymmetry principle. Self-consistent field (SCF) orbitals. Electronic states.

5. Molecular structure

Many-electron molecules: general approach. Born-Oppenheimer approximation. The hydrogen ion-molecule (MO-LCAO method). The hydrogen molecule. Diatomic molecules. Polyatomic molecules. pielectronic systems. Hückel method.

6. Foundations of Spectroscopy

Electromagnetic radiation. Spectroscopy: types of spectra. Radiation-matter interaction: semi-classical approximation. Boltzmann distribution law. The spectroscopic signal: position, intensity and width. Spectroscopic signal intensity. Lambert-Beer Law. Laser emission.

7. Rotation and Vibration Spectroscopies

Collective nuclear motion spectroscopies. Rotational energy levels of diatomic and linear molecules. Pure rotational spectra. Microwave spectroscopy. Vibrational energy levels. Vibration spectra of diatomic molecules. Rotation-vibration spectra. Vibration spectra of polyatomic molecules: vibration normal modes. IR spectroscopy. Raman spectroscopy.

8. Electronic Spectroscopy

Quantum interpretation of the electronic spectra: diatomic molecules. Vibrational structure: Franck-Condon principle. Selection rules. Electronic spectroscopy of polyatomic molecules. Fluorescence and phosphorescence.

WORKLOAD

ACTIVITY	Hours	% To be attended
Theory classes	51,00	100
Tutorials	9,00	100
Study and independent work	90,00	0
TOTA	L 150,00	917

TEACHING METHODOLOGY

The development of the course is structured around the following axis:

- lectures
- tutorials

With respect to the former, they will give an overview of the main topics and they will make emphasis on those key concepts necessary for their understanding. The most recommended resources for further preparation in depth of the subject will be indicated.

Tutorials will be devoted to the approach and resolution of problems and questions, which will allow for identifying the essential elements and concepts of each subject. For these sessions, a list of questions and problems will be provided that will serve for reinforcing the knowledge of the student and to exercise themselves in each subject discussed. The student must deliver the solved problems and questions as indicated by the teacher.

EVALUATION

The following assessment systems will be used:

- Tests consisting of written, oral, and/or practical exams
- Evaluation of group mentoring sessions, seminars, assignments and/or oral presentations
- Continuous assessment of each student based on classroom activities, participation and degree of involvement in the teaching-learning process.

The assessment of the student learning will take into account all aspects stated in the methodology section of this syllabus.

Modality A:

FIRST CALL

The final grade will consist of:

- The exam (75%), that consists of a series of theoretical questions (60%) and numerical problems (40%), which deal with the basic concepts taught in class. In order to average between the Theory and Problems parts of the final exam, the grade obtained in each of the parts must be greater than or equal to 4 over 10. The exam will be the same for all groups.
- Continuous assessment (25%) comprising short exams conducted throughout the academic year in the form of multiple choice tests or short answers, the assessment of group tutoring sessions, by performing and/or delivery of exercises and questions and continuous assessment of each student based on the participation and degree of involvement in the teaching-learning process. Only in exceptional cases and within the time limit set by the teachers, the continuous evaluation may be waived.

The grade of the written exam must be equal to or greater than 4.0 over 10 in order to do average with the grade from continuous assessment. The minimum overall grade to pass the subject is 5.0 over 10.

SECOND CALL

In the second call students will conduct an exam consisting of a series of theoretical questions and numerical problems, which will deal with the basic concepts taught in class. The exam will be the same for all groups. The final grades, including continuous evaluation, will be calculated using the same weighting as in the first call. The minimum overall grade to pass the subject is 5.0 over 10.

Modality B

This modality will only be accepted in very exceptional cases.

FIRST AND SECOND CALL

Students may choose to be evaluated only with an exam that in both first and second call will consist of a series of theoretical questions (60%) and numerical problems (40%), which deal with the basics taught in class. In order to average between the Theory and Problems parts of the final exam, the grade obtained in each of the parts must be greater than or equal to 4 over 10. The exam will be the same for all groups. The minimum overall grade to pass the subject is 5.0 over 10.

ADDENDUM COVID-19

This addendum will only be activated if the health situation requires so and with the prior agreement of the Governing Council

Contents

The contents initially indicated in the teaching guide are maintained.

Workload and temporary teaching planning

Regarding the workload:

The different activities described in the Teaching Guide are maintained with the intended dedication.

Regarding the temporary teaching planning:

The material to follow the theory/tutoring/classroom-seminar classes allows to continue the temporary teaching planning both in days and schedule, whether the teaching is face-to-face in the classroom or not.

Teaching Methodology

Theory classes and classroom tutoring will tend to the maximum possible face-to-face teaching, always respecting the health restrictions that limit the capacity of the classrooms to 50% of their usual occupation. Depending on the capacity of the classroom and the number of students enrolled, some of the students may need to follow the classes synchronously in an auxiliary classroom. If this situation arises, students will attend the main classroom or auxiliary classroom for weekly rotary shifts (preferably in alphabetical order). However, the rotation system will be fixed once the actual enrollment data is known, guaranteeing, in any case, that the percentage of face-to-face teaching of all students enrolled in the subject is the same.

If there is a closure of the facilities for health reasons that totally or partially affects the classes of the course, they will be replaced by non-face-to-face sessions following the established schedules and using the tools of the virtual classroom.

Evaluation

The evaluation system described in the Teaching Guide of the subject in which the various evaluable activities have been specified as well as their contribution to the final grade of the subject is maintained.

If there is a closure of the facilities for health reasons affecting the development of any face-to-face evaluable activity of the subject, it will be replaced by a test of a similar nature that will be carried out in virtual mode using the computer tools licensed by the University of Valencia. The contribution of each evaluable activity to the final grade of the subject will remain unchanged, as set out in this guide.

References

The literature recommended in the Teaching Guide is maintained since it is accessible, and it is complemented by notes, slides and problems uploaded to the Virtual Classroom as material of the course.
