SUMMARY

"*Prediction with Cross-Sectional Data*" is a basic training subject assigned to the areas of Quantitative Methods for the Economy and Business and Fundamentals of Economic Analysis that is taught in the first semester of the second year of the Degree in BUSINESS INTELLIGENCE AND ANALYTICS with a total study load of 6 ECTS credits.
Within the framework of a clearly oriented qualification to train business professionals with deep knowledge of the analysis and process of large volumes of information, this is the first subject, out of a set of 4, dedicated to predictive techniques, and it is done in the data framework cross-section and from the simplest possible statistical models. Other more complex data structures and models will be covered in later subjects.
The subject has an eminently practical and computational orientation. For this reason, the theoretical developments will be presented in a brief and schematic way, with special emphasis on their applicability and the intuition of the procedures - the theoretical classes represent 25% of the total teaching hours. The practices will be developed on examples with real data and specific software and the emphasis will be on the student's replicability of the results, as well as on decision-making in the process of building simple predictive models.

PREVIOUS KNOWLEDGE

Relationship to other subjects of the same degree

There are no specified enrollment restrictions with other subjects of the curriculum.

Other requirements

It is assumed that to successfully complete this subject the student has a basic level of mathematics (the knowledge corresponding to the first and second baccalaureate in the branch of science or social science) and is familiar with the contents of the subject "Exploratory Analysis of Data and Chance, Uncertainty and Inference previously submitted. At the same time, it is assumed that you have acquired some of the basic skills previously programmed in information management, software and use of ICT.

COMPETENCES (RD 1393/2007) // LEARNING OUTCOMES (RD 822/2021)

1332 - Degree in Business Intelligence and Analytics

- Students must have acquired knowledge and understanding in a specific field of study, on the basis of general secondary education and at a level that includes mainly knowledge drawn from advanced textbooks, but also some cutting-edge knowledge in their field of study.
- Students must be able to apply their knowledge to their work or vocation in a professional manner and have acquired the competences required for the preparation and defence of arguments and for problem solving in their field of study.
- Students must have the ability to gather and interpret relevant data (usually in their field of study) to make judgements that take relevant social, scientific or ethical issues into consideration.
- Students must be able to communicate information, ideas, problems and solutions to both expert and lay audiences.
- Students must have developed the learning skills needed to undertake further study with a high degree of autonomy.
- Acquire basic training that can be used to learn new methods and technologies and to adapt to new situations in academic and professional areas.
- Be able to solve problems and to communicate and spread knowledge, skills and abilities, taking account of the ethical, egalitarian and professional responsibility of the activity of business intelligence and analytics.
- Be able to make autonomous decisions in digital environments characterised by the abundance and dynamism of data.
- Know and know how to properly use the appropriate quantitative and qualitative methods to reason analytically, evaluate results and predict economic and financial magnitudes.

- Be able to apply analytical and mathematical methods for the analysis of economic and business problems.
- Be able to plan, organise, monitor and evaluate the implementation of business strategies.
- Demonstrate skills for analysis and synthesis.
- Be able to analyse and search for information from diverse sources.
- Be able to learn autonomously.
- Be able to use ICT, both in academia and in professional practice.
- Be able to define, solve and present complex problems systemically.
- Be able to work in a team demonstrating commitment to quality, ethics, equality and social responsibility.
- Apply methods and techniques of analysis, synthesis and graphical representation by means of software tools.
- Express situations of uncertainty and randomness using mathematical, synthetic and graphic languages.
- Reorganise and restructure variables and databases.
- Use data mining software.
- Use software tools to solve problems under uncertainty.
- Distinguish between the explanatory and predictive approaches in data analysis and in business.
- Make predictions using appropriate software tools to manage time series.
- Apply probability and non-probability sampling.
- Use software to collect and analyse survey data.

LEARNING OUTCOMES (RD 1393/2007) // NO CONTENT (RD 822/2021)

The objective of the course is for the student to be able to solve predictive problems through statistical modeling in a context of cross-sectional data.

It is intended that the student master the simplest techniques, starting from the simple regression models and some of its basic extensions: qualitative variables, nonlinear models, generalized linear models, local models.

The objective is also pursued so that the student manages these methods with powerful computer tools that can be integrated into the analysis of situations with large volumes of data. In this way the computational aspects are a totally essential aspect of the course.

DESCRIPTION OF CONTENTS

1. Introduction

Data structures and variable types.
Response variables and predictors.
Statistical modeling or learning.

2. Simple linear regression model

Estimation.
Ordinary least squares.
Goodness of fit.

3. Multiple linear regression model

Selection of regressors.
Information criteria.
Prediction.

4. Accuracy measurement in a predictive context.

Training set and test set.
The bias-variance trade-off.

5. Qualitative predictors

Treatment of qualitative information as predictors in the regression model.

6. Non-linear models

Regression transformation.
Non-linear least squares.

7. Local regression models

Splines
Local regression (lowess)

8. Generalized linear models

Binary output.
Linear probability model.
Logit / Probit model.
Classification errors in a binary context.

9. Re-sampling methods

Cross-validation
Bootstrap

WORKLOAD

ACTIVITY	Hours	% To be attended
Computer classroom practice	45,00	100
Theory classes	15,00	100
Development of individual work	10,00	0
Study and independent work	20,00	0
Preparation of evaluation activities	20,00	0
Preparing lectures	10,00	0
Preparation of practical classes and problem	10,00	0
Resolution of case studies	20,00	0
TOTAL	**150,00**	

TEACHING METHODOLOGY

The development of the subject is structured fundamentally around the differentiated theoretical and practical sessions, with the theoretical sessions being 1 hour a week (25%) and the practical sessions 3 hours a week (75%). The methodology, therefore, emphasizes the most practical and computational aspects of the subject.

In the theoretical sessions the foundations of statistical modeling or learning will be presented with special emphasis on the most intuitive aspects, and relegating the most theoretical and formal aspects to complementary readings.
In the practical sessions the theoretical aspects will be put into practice from a computational point of view, using specific software for this purpose, specifically R, which has become in recent years the reference software in statistical matters and data analysis. The student must use these tools to solve practical questions under the tutelage of the teacher. In this way, a certain role is given to the most practical aspects of the use of computer tools, and which is absolutely essential in modern society.

The predominant teaching method in the theoretical classes will be the participatory master class. This methodology allows the large groups of students to be led in an organized way, offering the advantages of a master class without limiting the participation of the students and the teacher-student interaction. An attempt will be made to encourage participation and discussion in the class, in order to offer students a direct involvement with the content.
In the practical sessions, lasting three hours, the teacher will propose to the students exercises, mainly from real data, for solving problems or case studies that they must solve by applying the techniques mentioned in the theoretical classes as well as the use of appropriate computer programs, performing if appropriate, oral presentations or discussions ..., individually and / or in teams. In the practical classes, projects and situations will be proposed that the students must solve, delivering the results that are determined in a timely manner.Send feedbackHistorySavedCommunity

EVALUATION

According to the verifies, the evaluation will consist of two parts:

• Evaluation of the practical activities carried out by the student during the course, starting with the delivery of exercises, test-type tests, and preparation of assignments. This set of activities will account for 80% of the grade for the course.

• Continuous assessment of each student, based on the participation and degree of involvement of the student in the teaching-learning process, taking into account regular attendance at the planned face-to-face activities. This set of activities will account for 20% of the grade for the course.

In both cases the activities will be non-recoverable.

This section has undergone substantial changes in section 11. Adenda-Covid-19.

ADDENDUM COVID-19

This addendum will only be activated if the health situation requires so and with the prior agreement of the Governing Council

Following the current recommendations from the University, the subject matter of the course will be continuously evaluated throughout it. Consequently, the continuous evaluation will represent 100% of the final grade. The continuous evaluation will be implemented in practice through tests that will consider both theoretical and practical questions, these tests or exercises may take place in the practical classes, for a limited time, or be resolved outside the classes and be delivered later on the dates indicated.

The detail of the tests, the exercises to be delivered, as well as the percentage that each of these activities represents in the final grade will be specified at the beginning of the course.

It should be noted, in addition, that for the academic year 2020-2021 it is foreseen that the teaching of this subject will be face-to-face, both in theory and in practice, therefore, following what is established in this Teaching Guide except in what refers to the evaluation , whose continuous part will represent 100% of the final grade. The tutorials, however, will be carried out on-line. However, if the health situation changes, it will be informed in due course of the modifications that will be made at the time to adapt teaching to the new scenario.
