SUMMARY

"Biotechnological Processes" is an optional subject of the Master in Chemical Engineering taught in Valencian in the second semester. It consists of 3 ECTS credits.

In order to provide the basic information for implementation and/or operation of bioprocesses on an industrial scale, the core of the course focuses on the peculiarities of biological reaction, mainly in mass transfer aspects (especially important in aerobic processes) and scaling-up; and in the design of sterilization at industrial scale. To provide an overview of biotechnology processes, the course is complemented by the study of typical examples of bioprocesses and downstream processing for biotechnology

The subject will be developed from the following contents:

- Introduction to industrial microbiology.
- Bioreactors: advanced designs, mass transfer, heat transfer and sterilization. Introduction to scale-up.
- Downstream processing in biotechnology.
- Bioprocesses technologies for waste treatment. Other applications of bioprocesses.

PREVIOUS KNOWLEDGE

Relationship to other subjects of the same degree

There are no specified enrollment restrictions with other subjects of the curriculum.

Other requirements

No prerequisites are needed for this subject

OUTCOMES

2209 - M.D. in Chemical Engineering

- Design products, processes, systems and services for the chemical industry and optimise others already developed, on the basis of the technologies of various areas of chemical engineering including transport processes and phenomena, separation operations and engineering of chemical, nuclear, electrochemical and biochemical reactions.
- Apply critical reasoning to their knowledge of mathematics, physics, chemistry, biology and other natural sciences, obtained through study, experience and practice, in order to establish economically viable solutions to technical problems.
- Be able to solve unfamiliar and ill-defined problems that have specifications in competition by considering all possible methods of solution, including the most innovative ones, and selecting the most appropriate, and correct implementation by evaluating the different design solutions.

LEARNING OUTCOMES

- Know fundamentals of microbial agents used in industral bioprocesses.
- Deepen on knowledge of bioreaction configurations and downstream processing on biotechnology.

- Deepen analysis of case studies on the design and use of bioprocesses.

In addition to those specified in the verified memory, the following will be obtained:

- Be able to size and to analyze agitation and aeration of bioreactors at industrial scale.
- Be able to size and to analyze sterilization at industrial scale.
- Know how to interpret and use information to solve practice cases.
- Develop skills to handle specialized bibliographic sources for finding, selecting and understanding the information.
- Be able to critically analyze the results of practical applications.
- Be able to write reports with clarity and order.

DESCRIPTION OF CONTENTS

1. Introduction

Introduction to industrial microbiology.
Historical and socioeconomic context of biochemical engineering.
Applications in bioprocesses.
Advanced designs of bioreactors.

2. Mass transfer in bioreactors

Mass transfer.
Aeration: gas-liquid mass transfer.
Agitation: Forced convection mass-transfer.

3. Sterilization in Bioprocesses

Heat sterilization and heat transfer in bioreactors.
Discontinuous sterilization of media.
Continuous sterilization of media.
Air sterilization.

4. Scale-up of bioreactors

Bases of scale-up.
Media sterilization. Aeration-agitation. Regime analysis and scale-down.

5. Applications in bioprocesses and downstream processing for biotechnology

Applications in bioprocesses.
Bioprocess technologies for waste treatment.
Downstream processing for biotechnology.

WORKLOAD

ACTIVITY	Hours	% To be attended
Theory classes	20,00	100
Classroom practices	10,00	100
Development of group work	3,00	0
Development of individual work	3,00	0
Study and independent work	10,00	0
Readings supplementary material	2,00	0
Preparation of evaluation activities	7,00	0
Preparing lectures	7,00	0
Preparation of practical classes and problem	7,00	0
Resolution of case studies	5,00	0
Resolution of online questionnaires	1,00	0
TOTAL	**75,00**	

TEACHING METHODOLOGY

The teaching methodology used in the subject will consider the following aspects:

Lecture sessions: An overview of the topic will be exposed and key concepts will be stressed to be developed. Information on resources will be offered to be used for the preparation of the subject in depth. Some practical cases will be worked to enhance the acquisition of concepts.

Practical lessons: Practical questions and problems to be solved by students will be proposed. The professor will work a number of problems-type, exercises and case studies to promote the acquisition of skills on the various aspects of the subject.

EVALUATION

The evaluation of the subject is based on the following items:

1. Objective test (75% of grade): Based on a written test with theoretical and practical questions.
2. Practical activities (20% of grade): Based on written work submitted to the professors (reports, problems solved, etc) and/or individual specific tests.
3. Continuous assessment (5% of grade): Based on regular course attendance and classroom activities.

The subject will be passed when the weighted average mark is equal to or greater than 5 (out of 10), being mandatory to obtain in the objective test a mark equal or greater than 4.5 (out of 10). If the mark of the objective test is below 4.5 (out of 10) that will be the global mark of the subject.

ADDENDUM COVID-19

This addendum will only be activated if the health situation requires so and with the prior agreement of the Governing Council

English version is not available

Contenidos

Se mantienen los contenidos inicialmente recogidos en la guía docente.

Volumen de trabajo y planificación temporal de la docencia

Respecto al volumen de trabajo:

Se mantienen las distintas actividades descritas en la Guía Docente con la dedicación prevista.

Respecto a la planificación temporal de la docencia

El material para el seguimiento de las clases de teoría/prácticas de aula permite continuar con la planificación temporal docente tanto en días como en horario, tanto si la docencia es presencial en el aula como si no lo es.

Metodología docente

El desarrollo de la asignatura se articula como se ha establecido para el segundo cuatrimestre.

Si se produce un cierre de las instalaciones por razones sanitarias que afecte total o parcialmente a las clases de la asignatura, éstas serán sustituidas por sesiones no presenciales siguiendo los horarios establecidos.

Evaluación

Se mantiene el sistema de evaluación descrito en la Guía Docente de la asignatura en la que se han especificado las distintas actividades evaluables, así como su contribución a la calificación final de la asignatura.

Si se produce un cierre de las instalaciones por razones sanitarias que afecte al desarrollo de alguna actividad evaluable presencial de la asignatura ésta será sustituida por una prueba de naturaleza similar que se realizará en modalidad virtual utilizando las herramientas informáticas licenciadas por la Universitat de València. La contribución de cada actividad evaluable a la calificación final de la asignatura permanecerá invariable, según lo establecido en esta guía.

Bibliografía

Se mantiene la bibliografía recomendada en la Guía Docente pues es accesible.
