Name		Department			
SECO TORRECILLA	S, MARIA AURORA	245 - Chemical Engineering			

SUMMARY

Professor UPV: María Pachés Giner

TThe subject "Environmental Quality Assessment" addresses the origins, problems, and effects of anthropic pollution on the aquatic, terrestrial and atmospheric environment. This subject develops the procedures and techniques for the measurement of environmental pollutants and the operation of environmental monitoring systems. The practical part of the course contributes to the acquisition of abilities, skills and attitudes necessary for the student to carry out the work in an environmental quality laboratory in a correct way. Successful completion of this subject enables the student to establish and apply the necessary criteria for evaluating the quality of water, air and soil and to manage and interpret

specifications, regulations and standards of environmental legislation.

PREVIOUS KNOWLEDGE

Relationship to other subjects of the same degree

There are no specified enrollment restrictions with other subjects of the curriculum.

Other requirements

No previous knowledge needed

COMPETENCES (RD 1393/2007) // LEARNING OUTCOMES (RD 822/2021)

2227 - Master's Degree in Environmental Engineering

- Students should apply acquired knowledge to solve problems in unfamiliar contexts within their field of study, including multidisciplinary scenarios.
- Students should be able to integrate knowledge and address the complexity of making informed judgments based on incomplete or limited information, including reflections on the social and ethical responsibilities associated with the application of their knowledge and judgments.
- Students should communicate conclusions and underlying knowledge clearly and unambiguously to both specialized and non-specialized audiences.
- Students should demonstrate self-directed learning skills for continued academic growth.
- Students should possess and understand foundational knowledge that enables original thinking and research in the field.
- Identify and apply technologies, tools and techniques in the field of environmental engineering.
- Assume with responsibility and ethics the Environmental Engineer role in a professional context.
- Adapt to changes, being able to apply the principles of Environmental Engineering to unknown cases and use new and advanced technologies and other relevant developments, with initiative and entrepreneurial spirit.
- Identify, declare and entirely analyze environmental problems.
- Apply standard methodologies for the analysis and evaluation of environmental risks.
- Apply different tools and environmental management systems.
- Evaluate the environmental quality of water from a global point of view, especially when there is a risk to public health.
- Evaluate the environmental quality of the air from a global point of view, especially when there is a risk to public health.

Vniver§itatö́dValència

- Evaluate the environmental quality of soils from a global point of view, especially when there is a risk to public health..
- Be able to characterize the emissions to air, coming from the anthropogenic activity.
- Be able to characterize the emissions to water, coming from the anthropogenic activity.
- Be able to characterize the emissions to soils, coming from the anthropogenic activity.

2250 - Master's Degree in Environmental Engineering

- Students should apply acquired knowledge to solve problems in unfamiliar contexts within their field of study, including multidisciplinary scenarios.
- Students should be able to integrate knowledge and address the complexity of making informed judgments based on incomplete or limited information, including reflections on the social and ethical responsibilities associated with the application of their knowledge and judgments.
- Students should communicate conclusions and underlying knowledge clearly and unambiguously to both specialized and non-specialized audiences.
- Students should demonstrate self-directed learning skills for continued academic growth.
- Students should possess and understand foundational knowledge that enables original thinking and research in the field.
- Identify, formulate and solve complex environmental engineering problems by applying engineering, scientific and mathematical principles.
- Recognise the ethical and professional responsibilities of environmental engineering and make informed judgements considering the impact of engineering solutions in global, economic, environmental and social contexts.
- Work in a team effectively and with leadership, in a collaborative and inclusive environment, setting goals, planning tasks and meeting objectives.
- Conduct appropriate experimentation, analyse and interpret data and use environmental engineering knowledge to draw conclusions.
- Learn and apply new knowledge, using appropriate learning strategies.
- Carry out a comprehensive assessment of environmental air quality.
- Carry out a comprehensive assessment of environmental water quality.
- Carry out a comprehensive assessment of environmental soil quality.
- Characterise emissions to air.
- Characterise emissions to water.
- Characterise emissions to land.
- Interpret and apply national and international environmental legislation and adapt environmental solutions to these regulations.

Vniver§itatötdValència

- Prepare and draft technical reports and/or environmental engineering projects considering technical, economic, social, energy and/or environmental aspects.

LEARNING OUTCOMES (RD 1393/2007) // NO CONTENT (RD 822/2021)

- 1 Know the origins of environmental pollution in water, air and soil.
- 2 Know the effects of pollution in water, air and soil.
- 3 Establish the criteria for the evaluation of water, air and soil quality.
- 4 Know the procedures and techniques for measuring environmental contaminants.
- 5 Be able to manage and interpret specifications, regulations and environmental quality standards.
- 6 Know the operation of the environmental monitoring systems and be able to interpret the information obtained.
- 7 Acquire experience at the laboratory level for the measurement of pollutants in water, air and soil.

DESCRIPTION OF CONTENTS

1. Introduction

2. Water

- 1. Sources and effects of water pollution
- 2. Measurement of water pollution
- 3. Environmental quality standards and water monitoring network

3. Air

- 1. Air quality parameters
- 2. Measurement of air pollution
- 3. Environmental quality standards and air monitoring network

4. Soil

- 1. Sources and effects of soil pollution
- 2. Measurement of soil pollution
- 3. Environmental quality standards and soil monitoring network

Vniver§itatö́ dValència

5. Laboratoy practices

- 1. Basic techniques in an Environmental testing laboratory
- 2. Water sample characterization (I)
- 3. Water sample characterization (I)
- 4. Soil sample characterization
- 5. Analysis of air quality data

WORKLOAD

ACTIVITY	Hours	% To be attended
Theory classes	28,00	100
Laboratory practices	14,00	100
Theoretical and practical classes	3,00	100
Development of group work	10,00	0
Study and independent work	20,00	0
Readings supplementary material	5,50	0
Preparing lectures	15,00	0
Preparation of practical classes and problem	17,00	0
TOTAL	112,50	2

TEACHING METHODOLOGY

The training activities will include:

Theoretical activities:

In the theoretical lessons the topics will be taught providing a global vision of the contemporary problems encouraging student participation

Practical activities:

Description: these activities complement the theoretical lessons with the aim of applying the concepts and develop them with the knowledge and experience that they acquire during the practical works. They include the following types:

- Environmental problem sessions
- Environmental Software-specific management practices
- Oral presentation

Individual and group tutorship Personal student work: performed out of classroom timetable based on bibliographic research, monographic works, problem resolution, etc. This task will be carried out individually and enhance the autonomous work of students.Small groups work: in 2 to 4 student's small groups, problems, technical questions are solved. These tasks boost the individual work, and encourage the students' integration. Assessment: performed an individual evaluation questionnaire in the classroom.

The e-learning platform (Virtual Classroom of the Universitat de València and / or PoliformaT of the Polytechnic University of Valencia) will be used as a communication support with the students. Through it students will have access to the subject material used in both theoretical and practical sessions.

EVALUATION

The evaluation of the subject consists of four parts:

-Part 1: Written open answer test on the theory part (40%). It will be necessary to obtain a grade equal to or higher than 4 out of 10 in this part so that the rest of the parts count in the global evaluation.

-Part 2: Objective test in which the knowledge acquired in the practice sessions will be valued (30%). It will be necessary to obtain a grade equal to or higher than 4 out of 10 in this part so that it counts in the global evaluation.

-Part 3: Academic work (20%) done on internships.

-Part 4: Continuous evaluation of each student, based on the observation, participation and degree of involvement of the student in the teaching-learning process (10%).

Attendance at the internship sessions is mandatory in order to successfully pass the subject.

Name	Description	Quantity	Weight
Open-ended written test	imed test, performed under control, in which the student constructs his answer. You may or may not be granted the right to consult supporting material	5	40,00%

Objective tests (test type)	Structured written exam with various questions or items in which the student does not prepare the answer; just point it out or complete it with very precise elements.	1	30,00%
--------------------------------	--	---	--------

Vniver§itatö́dValència

Academic work	Development of a project that can go from short and simple works to ample and complex works own of last courses and doctoral theses.	1	20,00%
Observation	Strategy based on the systematic collection of data in the learning context itself: execution of tasks, practices	1	10,00%
